

WHY DO NOT WE CAN AFFORD TO BURN MORE FOSSIL FUELS

Die of embarrassment

Ricardo Fraguas Poole

Some still do not see him in the same way that people accept the evidence and determined action to embrace change. It is very understandable. We have lived for too long with habits we did not know they were directly harmful to our health and the ecosystem that makes life as we know it. We hardly think and understand that what we consider normal have discovered that it is a genuine outrage that is killing us and causing irreparable damage.

There are still people with good will and based on the reasoning of "happened before and nothing happened," do not understand why we consider that smoking kills, when smoking kills, and forcing a child to breathe smoke snuff to share space who produces it is an outrage.

Not long ago I shared with you Brett Scott's proposal to approximate the feeling of collective voluntary blindness to the burning of fossil fuels and the daily use of petrol and gas, the terrible insensitivity of the mainstream of behavior before abolition of slavery.

Not being frowned upon and be widespread habit has not stopped us before we overcome our terrible misery and will not do so now.

We're going to get, we will be able to escape as irrational and unnecessary dependence on the supply and burning fossil fuels.

But every minute of unnecessary suffering, every loss, human, animal or plant life caused by our lazy delayed transition to a "low carbon" independent of oil, coal and gas, is irreparable harm that can not afford.

At this stage of development of mankind, in which we have achieved that energy needs can now be completely replaced by clean, renewable sources, we have a great opportunity to accelerate the pace.

It is our responsibility to do so from our various positions and capacities. Starting with our daily energy consumption habits to our life and transport.

It seems that the reserves of oil, gas and coal, are still being finite revealed abundant enough to allow us, if we burn at the same rate, a definitive end to life as we know it in, just, a few decades.

It does not seem very rational, does not seem very smart to die of embarrassment, is not it?

The best solution is to defend and flag has already many good people of The Guardian Sustainable Business: leave them where they are, "Keep it in the ground", at the same time advance in the use of clean and renewable energy sources.

Without advising us yet taken seriously, to give you an idea, in Spain, only the currently installed capacity of wind power and photovoltaic solar we are able to generate many days, almost all of the electricity needs of all country. How are you stay eh? As we did with the railway, road transport of people and goods can also be 100% electric, zero emissions.

You do not expect more, as soon as possible to encourage the use of renewable energy for your comfort and mobility and, if it is in

your hand, also join us in the generation of clean and renewable energy.
